

Learn how to develop a chiral chromatography method!

Contents and learning objectives

- What you have to consider at the start of a project: target (e.g. quality control, purification), sample characteristics and system specifications.
- How to find the optimum column by phase screening.
- Through optimisation of resolution, run time and selectivity to the final method.

Target group

Chromatography operators who are new to this field or who are already working with chiral separations.

Number of Attendees

4–8 people

Duration

2 hours

Date

On demand – please contact us and arrange your training date!
